

AI SMART FARMING ROBO PLANNER

Introduction

The AI Smart Farming Robo Planner is an Artificial Intelligence based project designed to assist farmers in managing agricultural activities efficiently. The system integrates intelligent path planning, irrigation scheduling, pest control recommendations, and weather-based decision support to improve farming productivity and resource utilization.

Project Objective

To develop an intelligent farming assistant that helps farmers make better decisions regarding irrigation, crop monitoring, pest management, and farm navigation.

Problem Statement

Traditional farming practices require continuous monitoring and manual decision-making. This project provides AI-powered recommendations to support effective farm management.

Technologies Used

Python, Lists and Dictionaries, Functions, OOP Concepts, File Handling, Search Algorithms.

AI Concepts Used

State Space Representation, BFS, DFS, A* Search, CSP, Heuristic Evaluation, Rule-Based Decision Making, Bayesian Reasoning, Intelligent Agent Model (PEAS).

Conclusion

The system demonstrates how Artificial Intelligence can improve agricultural productivity through intelligent planning and decision support.
